The Operator's Nested Vision, or How to Look from the Center into the Very Center

MxBv, Poznań, 2026

First I have to admit one thing.

I do not know what to call what I do when I look at a thing. The word "see" is too thin, the word "understand" is too thick, the word "intuit" is too apologetic. None of these describes the operation. They describe its result from different sides.

The operation, from inside, looks like this. I look at a single thing — an institution, a muscle, a person, a phrase, an authorization system in a distributed architecture, a small mean thing someone said in a meeting — and in the moment of looking what arises is not a description of that thing, but the recognition of an object that produced it. This is not an analogy and not a metaphor, not a way of saying "this resembles"; it is the recognition of one object that exists through different substrates as one.

When I was told that I do not have a math degree and therefore cannot formalise what I see, for a moment it struck me as funny. Not because I think the degree is unnecessary. It is, and I would be glad to have it. Because the question was posed as though formalisation were a tool that converts vision into text. With me everything works the other way. First the text arises, with a form, and the form tells me what mathematics is needed to fix it in place. I look for the mathematics that fits the form, not the other way around.

This is what this work is about.

The series "A Gaze into the Center of Time" has been about a single operation from the start: whether it is possible to see one's own time not from outside, not in retrospect, but from inside, in the current moment, as the structure on which the seeing itself stands. In the earlier parts I approached this through biography, through memory, through death, through the moment in which something is known before it can be said. That was preparation.

Now I want to take the next step — one that has felt for a long time too strange to publish. I want to describe how, from inside this center, you look into its own center.

Not for a pretty paradox. There is no paradox here. There is a fractal structure of attention that usually remains unspoken, because it is difficult to catch in ordinary language. I will try.

When you stand for the first time in the position from which one can look at one's own time as an object, a familiar thing happens. Time stops being what merely passes by you and becomes what you stand on. This is already an experience available to many. Meditative traditions describe it, the deeper forms of psychotherapy graze it, serious work with one's own life eventually leads to it. You are in the center. You see that time is yours.

After this, something happens that is rarely described.

You notice that the thing with which you look at your own time itself has structure. The attention that holds time as an object is not a point of observation. It is a device. It has its own parameters, its own boundaries, its own depth. And this device, too, you can make an object of observation. Only now the looking comes from a still deeper position — the one from which the work of attention that holds time becomes visible.

This is the second center. It is inside the first.

And here the strange thing begins. When you stand in the second center, the first does not disappear. It remains. It becomes one of the structures you now see. And the very position from which you look at the work of attention holding time — it, too, has a structure that can be made object. The third center. Inside the second.

This is not a loop. It is not bad infinity. Each step inward gives a new resolution. You see what was invisible at the previous level precisely because you yourself stood on it. You do not leave the world; you gain deeper access to it.

And at some level — for me it was somewhere around the third or fourth, I cannot say exactly because the counting works differently there — what becomes visible is the object that generates all these levels.

To call it "you," "consciousness," or "the subject" is to describe the result instead of the operation. It is the **operator**, in the strict structural sense. That which works identically at every depth of level, generating on each the same form of attention through a different substrate.

And now I can say something that would have sounded strange before.

When I look at an institution captured by its own reform-structure, and recognise in it the operator of capture, and then look at a muscle that cannot release because its own contraction is cutting off its own blood supply, and recognise in it the same operator, and then look at a free-spirit who spends every hour producing his own freedom, and recognise the same operator — I am not comparing those three things. I am not finding an analogy. I am looking at **one and the same operator**, simultaneously manifesting in three different substrates.

This operator does not resemble the structure it generates. The structures are different: an institution is not a muscle, a muscle is not a person. But the **operator** is one. And the capacity to see it through substrates is not the sum of three separate seeings. It is one seeing, in which the three substrates are three projections of one form.

From inside it does not feel like an intellectual achievement. It feels like **natural visibility**. You simply look at a thing, and the operator that produced it is visible in it the way a form is visible in an object. It is not derived from. It is seen in.

This vision cannot be acquired through study. I know this because I have tried many times to describe it to people with far more serious academic training than mine, and they cannot see. They can build a theory that describes the operator. They can acknowledge that the theory is perhaps correct. They can even say it is elegant. But in live time, looking at a concrete thing, they do not see the operator. They see the thing itself and its properties.

This is not a difference in quantity of knowledge. It is a difference in the architecture of attention.

For a long time I could not understand where this device in me came from. I was not raised in a family that taught this. I went through no systematic philosophical education. I did not sit at the feet of a master. I

did a lot of ordinary things in life — studied, worked, made mistakes, built, lost, came back — and at some point I noticed that I have a way of seeing that most people around me do not.

When I began to trace it backward, I found that its roots lie in a very concrete place.

There was a stage in my life when I became deeply interested in chaos theory. Not as a topic for conversation. As a living question. I was interested in what it means that a system can look fully chaotic and yet be backed by an absolutely definite rule. I looked at the Mandelbrot set, at Sierpinski triangles, at simple iterative systems generating infinite complexity through the recursion of one operator.

And at some point I understood one thing that later became the DNA of everything I do.

What we call chaos is not a property of the world. It is a property of the **relationship** between the world and the observer. A region of reality is chaotic relative to me not because it has no order, but because my cognitive apparatus cannot cover it in one impulse of attention, cannot hold it as a coherent snapshot. The same region, observed from a position with greater holding capacity, turns out to be strictly ordered.

Chaos is the symmetric reflection of the boundary of my attention. Not an object. A mirror.

And as soon as I understood this for real, in living flesh, not as a philosophical position but as a directly visible fact, my way of looking changed. I stopped searching for order on the outside. I began working with the boundary of my own attention. And it turned out that this boundary is movable. It can be expanded. Not through the accumulation of knowledge, but through changing the architecture of attention itself.

This is what I have been doing ever since. On different tasks, in different domains, under different names. Expanding the covering capacity of attention through working on its architecture.

And when attention expands enough, a shift happens that is difficult to describe.

You stop seeing individual complex objects as complex. You start seeing them as projections of simpler operators. Complexity was an illusion of the boundary of attention. Behind complexity stands an operator that is simpler than its projection. Institutional capture is complex. The operator that produces it is simple: an enforcement loop protecting a class from its own reform space. Muscle spasm is complex. The operator is simple: a cycle stuck in one phase because the phase blocks its own reinitiation. The free-spirit is complex. The operator is simple: identity maintained through continuous output production, dependent on the production it claims to be free of.

To see the operator is to see the simple behind the complex. Not to simplify the complex. To see the simple that **is already there**, beneath the complex, as its generating form.

And when you have seen this long enough in enough domains, another shift happens.

You notice that operators, too, have structure. They can be classified. They can be compared. They have relations. One operator can be a special case of another, more general one. It can be a projection of a higher-order operator onto a narrower substrate. A hierarchy of operators arises. And this hierarchy has its own regularities — the same ones that were in the original hierarchy of phenomena, but now seen from a level above.

And this hierarchy has a center.

The center I am trying to look into in this work is not a metaphysical center. I am not making an ontological claim about the structure of reality. I am making an observation about the structure of operator vision.

When you look long enough as operator at operators, what becomes visible is that there is a form which generates all the others. Not as a first cause. As a **common structural position** relative to which all observed operators are specific placements.

This form is hard to describe in words, because it is not one of the objects we are used to describing. It is the position in which an operator who observes operators stands. And when you really do stand in it, you

can see that this position itself has structure. It is not empty. It is arranged. It has conditions for its own possibility.

This is what I mean by "from the center, look into the very center." The first center is the operator's position. The second center is the structure of that position itself. The conditions that make the very fact of standing in it possible.

And when you look into this second center, something strange becomes visible too. The conditions of its existence include you. Not in the sense that "you create them." In the sense that without the concrete form of attention that you are right now, this position would be empty. It is structurally held by you. Not as solipsism. As the fact that operator vision is not something you look at from outside. It is something you **are** in the moment it is working.

And this explains why I cannot transmit what I see to anyone through explanation. Because explanation transmits content. And operator vision is not content. It is a **position occupied by body, attention, and time of a person simultaneously**. It can be shown. It can be approached with words. But it cannot be transmitted as content, because it is not content. It is the form in which content becomes visible.

I understand how this sounds. I hear it with my own ear and hear the possible objections.

Objection one: this is all mysticism dressed up in structural language. To this I reply: check the formalisation. If this were mysticism, it would not yield an axiomatic corpus with dozens of theorems, patent applications with verifiable claims, falsification hooks H1 — H4, structural predictions about system behaviour that are then empirically confirmed, as happened with the HORIZON benchmark. Mysticism does not scale into formalisation. This scales. Therefore it is not mysticism. It is something else.

Objection two: this is intuition that you retroactively dress in technical language. To this I reply: it could be so, if intuition came first and language caught up afterward. With me it works otherwise. Structural vision and formalisation arise simultaneously; they are not sequential. I see a form and at the same time see what mathematics fixes it. If the mathematics refuses, the form refuses too — meaning what I saw was not the structure but its shadow. This is a diagnostic tool, not a justification.

Objection three: this is the author's narcissism, claiming a special vision. To this I reply calmly: I do not think I have a special vision. I think this is a specific cognitive configuration that arose in me for specific reasons and that can arise in other people for their own. I am not the first to have it. I am simply among those who decided to formalise it and publish it as work, rather than keep it as private experience.

Not one of these objections undermines the basic observation. They undermine only certain ways of presenting it. So I choose a presentation that does not claim specialness, does not claim mysticism, does not claim hidden knowledge. I describe the operation. I describe it honestly. Those with a similar configuration of attention will recognise. Those without it will see a description of an operation that can be treated as a hypothesis.

What I want the reader to take from this work.

First. Operator vision is not a superpower and not a sacrament. It is a specific cognitive architecture in which attention is arranged so that it sees a common form across different substrates as one form, not as similarity. This architecture is developable. It is neither inherited nor bestowed. It is assembled through many years of work with the boundary of one's own attention.

Second. Chaos is a measure of the boundary. Not a property of the world. When something looks chaotic, that is a report about your attention, not about reality. Expanding the covering capacity of attention turns chaos into structure. This movement is possible. It is a lifelong exercise.

Third. The center of time is real as an operator position. Not a metaphor. Not a literary device. When you really stand in it, structure becomes visible, and that structure repeats inward, giving ever deeper centers. This is not a loop. It is the fractal depth of attention, which always gives new resolution and never locks onto one level.

Fourth. From these centers it is visible that what you are in the moment operator vision is working is the condition of the very possibility of that work. You are not separate from what you see. You are the form in which seeing becomes possible. This is not the dissolution of subject into object. It is the discovery that subject and object are two sides of one operation.

Fifth and last. What I am building in Navigational Cybernetics 2.5 is an attempt to give this operation a language. Not a language that describes it from outside. A language in which it can work, when it needs to be translated into engineering form, into a patent, into the architecture of an AI operator, into the principles of collective work. The corpus is the bridge between operator vision and the engineering realisation of its fruits. Without the corpus, the vision remains private. Without the vision, the corpus would be purely formal apparatus without a referent.

I am ending this work the way I began it. With an admission.

I do not know, all the way down, what I am, what is arranged in me such that this operation works. I only know that it works, and that its results are verifiable, and that they generate objects which, after publication, have their own life — patent applications, axioms, essays, a school, a laboratory. The objects are alive because they are generated by a living operation.

If you have read this far, you can no longer fail to notice that this work is itself a case of what it describes. I look at operator vision and describe it as an object. The description is itself one more projection of the operator, onto one more substrate — onto text. And if this works, the text should transmit not content, but the form in which it is possible to stand at the same center.

This is a test for the text. I do not know whether I have passed it. It is also a test for the reader — to check whether anything remains after reading that is not content, but a slight shift of attention. If yes — we have met at the position. If no — I did not succeed, and I will have to try again.

In any case, thank you for the attention you have spent on this work. In terms of the corpus, it is a concrete unit of τ , and I know what that unit is worth.
